March 17, 2020

Day 1

16 March 2020, Monday

This is my first jupyter notebook using VS Code! I really don't know what I'm doing, but here we go!

For this first project, I want to make a converter that converts someone's age into months using their birthdate. From there I'd like to make the program use user input. After that I'd like to try and make it a web-based app that can be used online.

My initial searches on Google have lead me to the datetime module.
<https://docs.python.org/3/library/datetime.html#module-datetime>

Hopefully I'll be able to find enough information here to get started.

```
[ ]: import datetime
```

So I don't actually know the proper definition of a python module.

After searching for it, from the official python documentation I found: A module is a file containing Python definitions and statements. <https://docs.python.org/3/tutorial/modules.html>
